After the debut of AutoCAD, graphics software using a raster graphics approach—such as Macromedia Illustrator and Adobe Photoshop—started to make significant inroads in the graphic design industry. During the period of time between the debut of AutoCAD in 1982 and the introduction of Windows 3.1 in 1990, the role of CAD has changed significantly. In the post-PC era,

CAD and design have become more of a software-intensive process and more tightly integrated with computers, which have become the primary tool of the designer. The Post-PC Era The development of Windows 3.1 (1990) and later operating systems has ushered in a post-PC era. This refers to a world in which the personal computer (PC) is no longer the main tool of the designer. It is now a tool to be used as part of a multi-user design environment. Many CAD programs offer design capture features, enabling users to quickly create and build a design through a drag-and-drop approach and without having to define the final form. This is an essential tool for an increasingly virtual world, as the design process becomes increasingly software-driven. An illustration of the post-PC era. This new model has transformed the role of the CAD designer. Before the post-PC era, CAD had been a product development tool and a support and distribution tool. Its users would work on a computer in the office, and when they finished the design, they would print the drawings on paper and take them to the engineer or vendor to implement the design. The post-PC era has changed this role significantly. The work is no longer performed at the CAD terminal. Instead, it is done through the computer. The idea that a computer can act as a design tool originated in the early 1970s. In 1972, the UNIVAC 1 introduced a program called VISI-TRACE that captured and reviewed the design of a mechanical part for three dimensions in a virtual environment on the monitor. It allowed the user to see the part from all sides simultaneously and manipulated the part in three dimensions. The earliest CAD software for personal computers was ESCHER, developed by the University of Michigan in 1971. Like VISI-TRACE, ESCHER was a system for capturing the design of a mechanical part. ESCHER used a computer mouse to move the part about the work area. In 1974, the first CAD software designed specifically for the desktop personal computer was released

My parents own a business called 'The Little House,' we travel to the homes of little kids who are being bullied by their neighbors. And it's a pretty unique thing to do, because we go into these kids homes and we build a little house and we get to build it with them, and then they decorate it for the season. And then we give it to them and we go back home. It's called The Little House because it's very small, it's about the size of the house that I grew up in. I've done it for over 10 years. Every year, we do our biggest holiday event, which is called 'Season's Greetings.' And that's when we go into the homes of kids who have been very kind and have great parents, and we build a tiny house for them, and we decorate it and we present it to them and it's really a happy ending. We end our season with that, we build a big beautiful house for them and send them off to school with a big thank you. We have this as a special program for kids with disabilities, and we're known as The Little House on the Helping Hand. It's about a year ago that we made that change, because a kid with autism came to us and he said a1d647c40b
