The plugin is a band-limited frequency-dependent first order IIR amplifier / compressor. This means that it offers the common features of the other models of this genre (EZD, Elasticizer and Soundtoys Group Align V3) but also includes some tweaks of his own in the same time. Filta Crunch features 8 different modes, each one designed to a particular purpose: -- Long-Time Release: -- Short-Time Release: -- Tone: -- Echo: -- Tape: -- Classical: -- Vox: -- Bass: Apart from these 8 main modes the plugin includes a sophisticated auto-exposure mechanism for the longest and the shortest release times. This comes at a cost of a rather slow algorithm and therefore, a higher CPU usage. So choose wisely which mode you want to use. You can load presets created by other users or you can create your own presets and load them later. In this presets library we also have a Reverb effects section, which is currently empty (why not). Also, we have a textured sound that can be really nicely modified using a real wah-wah effect with a velocity pedal. The filter has a very high cut-off frequency band for a very 'sharper' sound with the aid of an external low-pass filter. The high frequency boost in the analysis stage is calculated so high and the amount to be boosted in the analysis stage so low, that a lot of harshness is taken off the voice before the final compression is applied. This is in contrast to the other EZD plugins I have written. How does it work? The waveform is being continuously analysed for high frequency peaks over a user-defined time. As soon as there are peaks above the user-defined minimum frequency they are boosted and the filter continues to process these very peaks. If a peak is below the threshold and the lowest peak is below the threshold it is not processed. Every time a peak is processed the filter waveform is being reshaped in a wave-shaper circuit so that maximum distortion is achieved while maintaining a flat response over the audible range. The amount of distortion is being controlled by the waveshaper

The plugin is composed from a 2-Pole 24db type filter, a wave-shaper with gain, as well as a dual channel tube amp drive. It also provides users with the possibility to save their presets once they obtain a desired effect, as well as automate the plugin controls using a MIDI device. You are provided with a preset library, where you can create your own profiles, assign names to them and load them later, when needed. Among the parameters that can be adjusted from the main window, you can find filter cutoff, smooth, res, filter drive, waveshaper X, normalize and wave drive. Graphical user interface You can use the interface that can be obtained from any of the supported host programs, to maximize the parameters and to specify your desired sound. R-LFOs, LFO Envelope, MIDI In and MIDI Out port Filta Crunch can operate either in a 'jagged mode' or in an 'even-adorned' way. With the first approach, the R-LFO is used to control the LFO of the filter and the LFO Envelope to control the LFO's envelope. The second approach is based on the normalization of the peaks of the two envelopes and the R-LFO. With MIDI In and MIDI Out ports, the plugin can be controlled by a MIDI controller keyboard or by using MIDI In and Out commands.
