There is a simple bound list of categories. In WindowViewModel I have a property of type ObservableCollection named CategoryViewModels. In WindowViewModel I bound it to my collection this.DataContext = windowViewModel; Then I want to set a collection of Categories for one list box this.CategoryViewModels.Add(categories); this.CategoriesListBox.ItemsSource = this.CategoryViewModels; The problem is that no matter how I bind the list box, only the last categories from the passed collection gets added to it. But why? How do I tell my ListBox that it should bind to a new ObservableCollection? A: The mistake was that I bound to a simple collection, which led to the behaviour described in this question. An electric motor comprises a rotor and a stator. One of the two is mounted inside a bearing in a rotary position and the other is mounted outside the bearing and is fixed to a stationary position. The rotor usually operates as a motor, wherein there is a magnetic coupling between the magnetic field of the stator and the magnetic field of the rotor. This coupling provides a magnetic torque which drives the rotor. The rotor can, in principle, also be converted into a generator, wherein there is generated a current flow by the rotor moving in the stator. In general, no continuous current flow is supplied by a motor, i.e. the current flow is pulsed. In a motor, the rotor also acts as a generator during startup, when a certain current is supplied. In order to avoid the above mentioned magnetic coupling, the electric motor is, in principle, connected to a commutator. During operation of the motor, a 82138339de
