So, if you own a new phone or tablet and would like to play your favorite games or apps on an external monitor (or larger than usual screen), a USB dongle is the solution. Many different types of USB dongles are available, but all USB dongles work in the same way. Connecting your USB dongle to your device allows you to use it as a USB device. There is a port on your USB dongle that allows you to connect a wire to attach to your monitor, keyboard, or mouse. Then you simply disconnect your device and continue using it as usual. Many of the existing USB dongles are fairly small, measuring about 3.5 inches by 2 inches. They do have some drawbacks, though. They are typically located on the bottom of the case, and they use only one to two USB ports. Also, most USB dongles lack a power supply, which means that you have to use an external battery pack to power your USB dongle. iPhone 5 usb dongle: The new USB dongle for the iPhone 5 is significantly larger than most existing USB dongles. It measures 8.7 inches by 5.6 inches by 0.7 inches, making it wider and heavier than any of the previous USB dongles. Its weight is about 7 ounces, or less than half a pound. The USB dongle also uses a total of four USB ports, including a Lightning connection for charging your iPhone 5 via a third-party wall charger or Apple adapter. The USB dongle can be used with almost any computer that has a USB port, but its Lightning port can also be used to charge your iPhone 5. It's also compatible with all current Bluetooth keyboards and mice. It is available for about $25 on Amazon.com. Hackintosh Developer: Nick Suidgeon is a developer at CrowdStrike. The theme offers nice looking and vibrant wallpapers for the desktop In the world of PC customization, we often try to modify various settings to try to make the computer run better, while saving money as much as possible. However, sometimes it is impossible to find the settings that you want, as many are buried deep in the settings of your computer. Yet, here are several of the most important settings to modify in order to improve performance of your computer: Power-saving settings If you are one of those users whose computer shuts down automatically after five minutes of inactivity, you can change this setting so that you can manually power off the computer whenever you need. Also, when your computer is running on low energy, you can reduce the amount of power it uses. For that, you should access the Power Options > Change advanced power settings from the Control Panel and adjust the settings as follows: "Dim display after..." – seconds (adjust the time frame according to your need) "Dim display" – Check this box to prevent the screen from dimming (you can also use the above option) "Dim display when inactive" – Check this box to prevent the screen from dimming when you are not using it (again, you can use the above option) "Turn off..." – to choose a specific time to shut off the computer after being inactive for a long time, you can add a specific time frame for your needs. For example, you can set it for 5 minutes and if you have a startup notification, you will also get an alert that your computer will shut down in five minutes. There are several other power-saving options you can change that are about saving energy and decreasing heat generation, however, these are simply variations on these mentioned above, which are the most important ones to be changed. Speeding up your PC More often than not, lack of performance can be related to some things that one should consider when it comes to upgrading, repairing or simply upgrading a particular aspect of your computer. For example, if you find it hard to use your computer at times and you are having a problem with games that you play, you may want to consider upgrading the CPU or the GPU of your computer, and try to use a separate graphic card, if available.
