While Microsoft claims the Photos app for Windows 8.1 is going to be all about sharing your photos, that's not exactly true. When you take a picture using the Photos app, the camera app is also involved. The application also syncs images between the app and other devices and sites. So, you need to be aware of the consequences of what you do and what you share. When you use the Photos app, you can select a photo or start with one of the pre-configured layouts. The moment you open the app, however, it asks if you want to import images into the app or to choose a folder full of existing images. The fact is, what you import into the app determines the settings that you can apply and other settings that have been automatically applied. Take a picture and import it.

Mica For Everyone! is a lightweight utility that enables you to add the backdrop effect on the title bar for win32 applications on Windows 11. Simply change the title bar color from the System Tray The program does not have an interface per se, but rather you can access it from the System Tray to customize the looks and feels of win32 apps. According to the developer, the customization is possible directly via the options provided in the app or via the configuration file. Moreover, because it employs DwmSetWindowAttribute, the backdrop effect is going to be visible on all open windows. The Extend Frame Into Client Area is an option whose role is to extend the window frame so that Mica becomes visible on the entire app's background. Unfortunately, since the applications in general draw their own background on top of the window, it does not work. As the developer points out, the feature is mostly there for testing purposes and, while you can play around with it, it is not recommended as daily use. This invention relates to a heat-resistant binder for a ceramic material. More specifically, it relates to a heat-resistant binder for a ceramic material having a thermosetting temperature of 80.degree. C. or higher and having excellent chemical resistance and adhesion to the ceramic material at a temperature of 800.degree. C. or higher. Inorganic powder materials such as glass and clay are molded into the shapes of ceramic articles by use of a binder. As binders, there are known thermosetting organic polymers and inorganic binder compositions. The thermosetting organic polymers have many advantages, such as heat resistance, water resistance, and better mold release properties than the inorganic binders. However, they are generally undesirable in that they have low adhesion to ceramic materials. Therefore, they are unsuitable for the production of ceramic articles which must be fired at a high temperature. Inorganic binder compositions have heat resistance and chemical resistance in addition to strong adhesion to ceramic materials. However, it is necessary to fire the binder at a high temperature at which the binder is soft or must add an additive to prevent cracking of the ceramic articles to be produced. In recent years, a lot of proposals for imparting heat resistance and chemical resistance to a thermosetting binder have been put forward. For example,
